# 1. GENERAL DESCRIPTION

#### 1.1 OVERVIEW

N141I1 - L01 is a 14.1" TFT Liquid Crystal Display module with single CCFL Backlight unit and 30 pins LVDS interface. This module supports 1280 x 800 XGA mode and can display 262,144 colors. The optimum viewing angle is at 6 o'clock direction. The inverter module for Backlight is built in.

## 1.2 FEATURES

- Thin and Light Weight
- WXGA (1280 x 800 pixels) resolution
- DE only mode
- 3.3V LVDS (Low Voltage Differential Signaling) interface with 1 pixel/clock

## 1.3 APPLICATION

- TFT LCD Notebook

Vibration (Non-Operating)	$V_{NOP}$	-	2.0	G	(4), (5)	

Note (1) Temperature and relative humidity range is shown in the figure below.

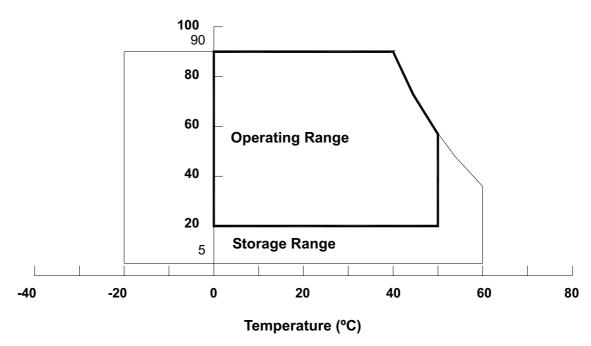

- (a) 90 %RH Max. (Ta  $\leq$  40 °C).
- (b) Wet-bulb temperature should be 39 °C Max. (Ta > 40 °C).
- (c) No condensation.
- Note (2) The ambient temperature means the temperature of panel surface.
- Note (3) 2ms, half sine wave, 1 times for  $\pm$  X,  $\pm$  Y,  $\pm$  Z.

Note (4) 10 ~ 500 Hz, Sweep rate 10min, 30min for X, Y, Z. The fixing condition is shown as below:

Note (5) At testing Vibration and Shock, the fixture in holding the module has to be hard and rigid enough so that the module would not be twisted or bent by the fixture.

## Relative Humidity (%RH)

b. Black Pattern

**Active Area** 

- Note (4) The specified power are the sum of LCD panel electronics input power and the inverter input power. Test conditions are as follows.
  - (a) Vcc = 3.3 V,  $Ta = 25 \pm 2 \,^{\circ}\text{C}$ ,  $f_v = 60 \,^{\circ}\text{Hz}$ ,
  - (b) The pattern used is a black and white 32 x 36 checkerboard, slide #100 from the VESA file "Flat Panel Display Monitor Setup Patterns", FPDMSU.ppt.
  - (c) Luminance: 60 nits.
  - (d) The inverter used is provided from O2Micro (www.o2micro.com). Please contact O2Mirco for detail information. CMO provides the inverter in this product.

Lamp Life Time	$L_BL$	15,000			Hrs	(5)
Power Consumption	$P_L$		4.02		W	$(4)$ , $I_L = 6.0 \text{ mA}$

Note (1) Lamp current is measured by utilizing a high frequency current meter as shown below:

- Note (2) The voltage shown above should be applied to the lamp for more than 1 second after startup. Otherwise the lamp may not be turned on.
- Note (3) The lamp frequency may produce interference with horizontal synchronous frequency from the display, and this may cause line flow on the display. In order to avoid interference, the lamp frequency should be detached from the horizontal synchronous frequency and its harmonics as far as possible.
- Note (4)  $P_L = I_L \times V_L$
- Note (5) The lifetime of lamp can be defined as the time in which it continues to operate under the condition Ta = 25  $\pm 2$  °C and I<sub>L</sub> = 6 mArms until one of the following events occurs:
  - (a) When the brightness becomes or lower than 50% of its original value.
  - (b) When the effective ignition length becomes or lower than 80% of its original value. (Effective ignition length is defined as an area that has less than 70% brightness compared to the brightness in the center point.)
- Note (6) The waveform of the voltage output of inverter must be area-symmetric and the design of the inverter must have specifications for the modularized lamp. The performance of the Backlight, such as lifetime or brightness, is greatly influenced by the characteristics of the DC-AC inverter for the lamp. All the parameters of an inverter should be carefully designed to avoid producing too much current leakage from high voltage output of the inverter. When designing or ordering the inverter please make sure that a poor lighting caused by the mismatch of the Backlight and the inverter (miss-lighting, flicker, etc.) never occurs. If the above situation is confirmed, the module should be operated in the same manners when it is installed in your instrument.

The output of the inverter must have symmetrical (negative and positive) voltage waveform and symmetrical current waveform. (Unsymmetrical ratio is less than 5%) Please do not use the inverter

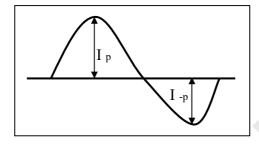

which has unsymmetrical voltage and unsymmetrical current and spike wave. Lamp frequency may produce interface with horizontal synchronous frequency and as a result this may cause beat on the display. Therefore lamp frequency shall be as away possible from the horizontal synchronous frequency and from its harmonics in order to prevent interference.

Requirements for a system inverter design, which is intended to have a better display performance, a better power efficiency and a more reliable lamp. It shall help increase the lamp lifetime and reduce its leakage current.

- a. The asymmetry rate of the inverter waveform should be 5% below.
- b. The distortion rate of the waveform should be within  $\sqrt{2 \pm 10\%}$ .
- c. The ideal sine wave form shall be symmetric in positive and negative polarities.

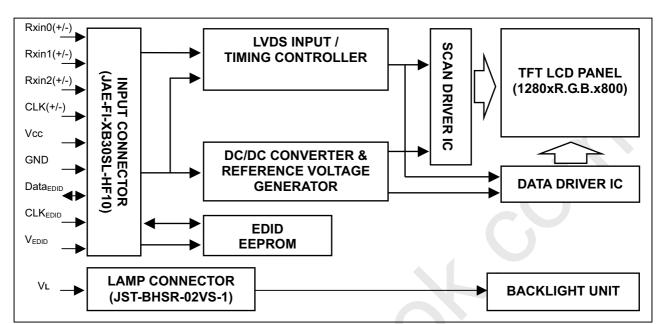

- \* Asymmetry rate:  $| I_p I_{-p} | / \text{Max} (I_p, I_{-p}) * 100\%$
- \* Distortion rate

 $I_p (or I_{-p}) / I_{rms}$

## Remarks:

(1) Input Voltage

The operating input voltage of inverter shall be defined.

The inverter shall be igniting the CCFL lamp at minimum input voltage at any environment conditions.

(2) On/Off control

Enable: At "ON" condition (FPBACK=Hi), enable the inverter.

Disable: At "OFF" condition (FPB ACK=Lo), disable the inverter.

(3) Quiescent current

At the inverter "OFF" condition, input quiescent should be less than 0.1mA.

(4) Open lamp voltage

The inverter start-up output voltage will be above "Vopen" for "Ts" minimum at any condition under specify until lamp to be ignited. The inverter should be shutdown if lamp ignition was failed in "Ts" maximum. The inverter shall be capable of withstanding the output connections open without component over-stress / fire / smoke /arc.

(5) Burst mode frequency

The burst mode frequency should be in specification in any environment condition and electrical condition.

(6) Power up Overshoot & Undershoot

Overshoot & Undershoot at power up should not exceed the following limits.

Vin	Output current	lo (dl)	Settling time	
VIII	lo(rms)	Overshoot/Undershoot	(dT)	
0→Vin(min.)	lout(max.)	150% / 50%	5 ms max.

0 × viii(iiiax.)	lout(min.)	130 /6 / 30 /6	J III3 IIIax.	

dl=lmax.-lo or dl=(lo-lmin.)/lo

(7) Output connections short protection

The inverter shall be capable of withstanding the output connections short without damage or

over-stress. And the inverter maximum input power shall be limited within 1W.

- Note (1) Please avoid floating state of interface signal at invalid period.
- Note (2) When the interface signal is invalid, be sure to pull down the power supply of LCD Vcc to 0 V.
- Note (3) The Backlight inverter power must be turned on after the power supply for the logic and the interface signal is valid. The Backlight inverter power must be turned off before the power supply for the logic and the interface signal is invalid.
- Note (4) Sometimes some slight noise shows when LCD is turned off (even backlight is already off). To avoid this phenomenon, we suggest that the Vcc falling time had better to follow

Note (1) Definition of Viewing Angle ( $\theta x$ ,  $\theta y$ ):

Note (2) Definition of Contrast Ratio (CR):

The contrast ratio can be calculated by the following expression.

Contrast Ratio (CR) = L63 / L0

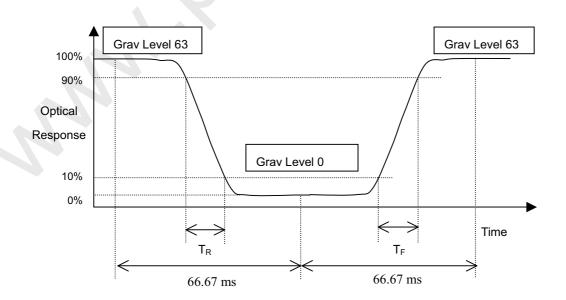

L63: Luminance of gray level 63

L 0: Luminance of gray level 0

CR = CR(5)

CR (X) is corresponding to the Contrast Ratio of the point X at Figure in Note (6).

Note (3) Definition of Response Time (T<sub>R</sub>, T<sub>F</sub>):

Issued Date: Jul 15, 2005 Model No.: N141I1 - L01 **Preliminary** 

Note (4) Definition of Average Luminance of White (LAVE):

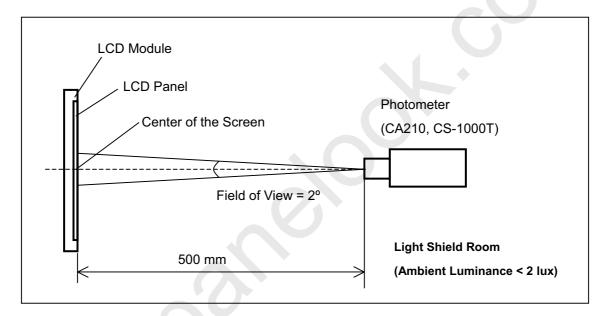

Measure the luminance of gray level 63 at 5 points

$$L_{AVE} = [L (1) + L (2) + L (3) + L (4) + L (5)] / 5$$

L (x) is corresponding to the luminance of the point X at Figure in Note (6)

## Note (5) Measurement Setup:

The LCD module should be stabilized at given temperature for 20 minutes to avoid abrupt temperature change during measuring. In order to stabilize the luminance, the measurement should be executed after lighting Backlight for 20 minutes in a windless room.

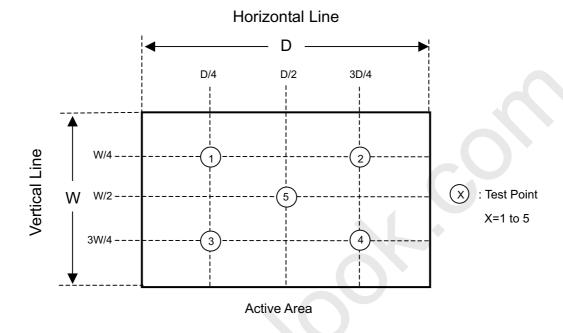

Issued Date: Jul 15, 2005 Model No.: N141I1 - L01 **Preliminary** 

Note (6) Definition of White Variation ( $\delta W$ ):

Measure the luminance of gray level 63 at 5 points

 $\delta W = Maximum [L (1), L (2), L (3), L (4), L (5)] / Minimum [L (1), L (2), L (3), L (4), L (5)]$ 

# 9. PRECAUTIONS

## 9.1 ASSEMBLY AND HANDLING PRECAUTIONS

- (1) Do not apply rough force such as bending or twisting to the module during assembly.
- (2) To assemble or install module into user's system can be only in clean working areas. The dust and oil may cause electrical short or worsen the polarizer.
- (3) It's not permitted to have pressure or impulse on the module because the LCD panel and Backlight will be damaged.
- (4) Always follow the correct power sequence when LCD module is connecting and operating. This can prevent damage to the CMOS LSI chips during latch-up.
- (5) Do not pull the I/F connector in or out while the module is operating.
- (6) Do not disassemble the module.
- (7) Use a soft dry cloth without chemicals for cleaning, because the surface of polarizer is very soft and easily scratched.
- (8) It is dangerous that moisture come into or contacted the LCD module, because moisture may damage LCD module when it is operating.
- (9) High temperature or humidity may reduce the performance of module. Please store LCD module within the specified storage conditions.
- (10) When ambient temperature is lower than 10°C may reduce the display quality. For example, the response time will become slowly, and the starting voltage of CCFL will be higher than room temperature.

#### 9.2 SAFETY PRECAUTIONS

- (1) The startup voltage of Backlight is approximately 1000 Volts. It may cause electrical shock while assembling with inverter. Do not disassemble the module or insert anything into the Backlight unit.
- (2) If the liquid crystal material leaks from the panel, it should be kept away from the eyes or mouth. In case of contact with hands, skin or clothes, it has to be washed away thoroughly with soap.
- (3) After the module's end of life, it is not harmful in case of normal operation and storage.
